CAUSES OF PSYCHOLOGICAL TRAUMA
Psychological trauma can occur when a person's ability to manage events in her life is overwhelmed by the occurrence of a particularly challenging or unfamiliar event. The following are definitions of psychological trauma.

Psychic trauma occurs when an individual is exposed to an overwhelming event resulting in helplessness in the face of intolerable danger, anxiety and instinctual arousal. Eth and Pynoos\textsuperscript{1} pg 38

Psychic trauma is the mental result of one sudden, external blow or a series of blows, rendering the young person temporarily helpless and breaking past ordinary coping and defensive operations. Terr\textsuperscript{2}

Traumatic events...overwhelm ordinary human adaptations to life. Herman\textsuperscript{3}

Psychological trauma theory recognizes the role of distressing life events in the development of many of the psychological problems people suffer from. Recovery most effectively occurs in the context of a society and a set of personal relationships where the reality and the injustice of traumatizing, often abusive, events are acknowledged. And before any recovery can be expected, the traumatizing events must cease. Child protective social workers play a key role both in the social acknowledgement that child abuse occurs and in guaranteeing that efforts are made to ensure that these children are safe in the future. Mental health professionals cannot help children recover from the traumatic effects of abuse experiences if the abuse itself has not stopped. Protective workers thus play a critical role not only in ensuring that children are safe from abuse but also in the effort to address the psychological trauma which results from child abuse and neglect.

Psychological trauma can occur when a person's coping abilities are overwhelmed. But it's important to remember that having one's abilities overwhelmed is also a normal developmental process. We often learn and grow by being forced to "stretch", to develop new capacities which help us address new tasks. Being overwhelmed in and of
itself is not necessarily traumatizing. The trauma effect can occur when we are overly overwhelmed, and usually when the event causing the trauma is a negative incident which we would hope would never have occurred.

Ronnie Janoff-Bulman views trauma as the result of shattered assumptions about ourselves and the world. Janoff-Bulman reasons that we develop assumptions about ourselves and the world which allow us to build a life with purpose, coherence and meaning, and that traumatic events tend to shatter these assumptions. She posits that the following are key assumptions which, when shattered, can lead to psychological trauma.

ASSUMPTION OF INVULNERABILITY
WORLD AS MEANINGFUL
POSITIVE SELF-PERCEPTIONS

EFFECTS OF PSYCHOLOGICAL TRAUMA

The following is a list of some effects of psychological trauma.

| IRRITABILITY   | INTRUSIVE THOUGHTS |
| STARTLE RESPONSE | DISSOCIATION |
| NIGHTMARES       | NUMBNESS |
| FLASHBACKS       | HYPERVIGILANCE |
| DETACHMENT       | REPETITIVE MEMORIES |
| CHANGED ATTITUDES | PARALYSIS |
| PANIC            | TIME DISTORTIONS |
| SHOCK            | CONFUSION |
| ANXIETY          | SELF-DESTRUCTIVENESS |
| AMNESIA          | INSTABILITY |
| DEPRESSION       | AGGRESSION |
| FEARS            | IMMOBILIZATION |

People develop psychological means of protecting themselves when overwhelming events occur. Often the overwhelming material gets pushed away, through the psychological mechanisms of numbing, dissociation and denial. But these thoughts or feelings are seldom pushed away completely, and they tend to reappear in the form of flooding, intrusive thoughts and repetitive behaviors. The effects of psychological trauma can be broken down into the numbing and the flooding types of responses.

Life experiences which are warded off through numbing or dissociation remain with a person. They tend to reemerge through flooding mechanisms, often set off by triggers. Flooding refers to intensive remembering, through intrusive thoughts or feelings, of traumatic events which previously were pushed away from conscious experience. Triggering stimuli, which are not harmful in and of themselves but rather evoke memories of an earlier critical incident, operate to set off painful, confusing responses. Flooding responses can be helpful in that they encourage a person to integrate past experiences, yet hurtful in that they can be the source of constant and often severe retraumatization.
A simple version of the operation of numbing and flooding mechanisms is graphically represented below.

**WHAT HELPS AFTER PSYCHOLOGICAL TRAUMA HAS OCCURRED**

Help for the effects of psychological trauma takes many forms. Psychotherapy can provide a useful forum for sorting out both details of the memories and effects of the critical event, and for developing coping strategies. Most of the recovery and healing which can take place after trauma has occurred happens in the daily life of the traumatized person. A person who has been traumatized must learn to live in the world anew, to rebuild safe and working relationships with self and others. Traumatized children, especially those traumatized by abuse or abandonment within their families, are especially vulnerable to the negative effects of trauma. They may have few
established, effective coping skills to fall back on, and their young, emerging personalities can be greatly shaped by the fallout from the traumatizing event. Children need opportunities to develop the relationships and coping skills which will allow them to stay attuned to themselves, connected to others and motivated to function and thrive in the world around them.

Healing from psychological trauma occurs in three stages, stages which a person may cycle through a number of times as the negative effects of the traumatic event recede.

GET IT TOGETHER

SOCIAL WORKERS AND PSYCHOLOGICAL TRAUMA
Social workers can be effected by psychological trauma. This trauma can best be understood by examining the effects of direct traumatization and vicarious traumatization on social workers, and by considering the role of personal vulnerability in traumatization.

DIRECT               INDIRECT
TRAUMATIZATION      TRAUMATIZATION

PERSONAL VULNERABILITIES

RESPONSES SOCIAL WORKERS MIGHT EXHIBIT:

<table>
<thead>
<tr>
<th>Intrusive Thoughts</th>
<th>Nightmares</th>
</tr>
</thead>
<tbody>
<tr>
<td>Somatic Symptoms</td>
<td>Withdrawal</td>
</tr>
<tr>
<td>Isolation</td>
<td>Anger</td>
</tr>
<tr>
<td>Depression</td>
<td>Decreased Morale</td>
</tr>
<tr>
<td>Diminished Capacity</td>
<td>Diminished Job Commitment</td>
</tr>
<tr>
<td>To Work Independently</td>
<td></td>
</tr>
</tbody>
</table>
Particular casework scenarios affect different social workers in varying ways. An incident which may overwhelm one person is manageable for another. Yet all of us have areas of vulnerability, and the range of psychological trauma which clients experience is likely to include areas in which most social workers would experience some vulnerability.

The following questions have been designed to assist you in identifying workplace events which could have a negative psychological impact on you. Addressing these questions, alone or with a friend, colleague or supervisor, may prove useful in managing any potential negative effects of these workplace events. The goals of this exercise are stated below.

- Identify the trauma effects posed by specific workplace events
- Develop strategies for addressing these issues
- Enhance your awareness of your own vulnerabilities

1) What is the current event which may directly or indirectly traumatize you?

2) What themes relate to this event? (circle below)
   - Trust
   - Safety
   - Rape
   - Power
   - Loss
   - Hope
   - Caretaking
   - Hopelessness
   - Connection
   - Evil
   - Abandonment
   - Violence
   - Betrayal
   - Powerlessness
   - Others ___________ ___________ ___________

3) Does this event remind you of events in your own life? What are they?
4) What themes are sources of vulnerability for you?

Trust    Safety    Rape    Power    Loss    Hope
Caretaking   Hopelessness   Connection   Evil
Abandonment    Violence    Betrayal    Powerlessness
Others    _________    _________    _________

5) Does this workplace event evoke vulnerable themes in your life?

6) Do you identify with the clients involved in this event?

7) How could this event traumatize a social worker?

8) What trauma effects is this event having on you?

9) Is there a place where you can safely discuss this event and be understood?

10) What can you do to limit on-going exposure to this direct or indirect trauma?
   1. ____________________________________
   2. ____________________________________

11) What can you do to take care of yourself in the face of this event?
   1. ____________________________________
   2. ____________________________________
Resilience refers to the ability to weather the storm, to bounce back after a critical event with little evidence of psychological trauma. The following factors have been found to correlate with resilience in childhood.

**INDIVIDUAL CORRELATES OF RESILIENCE**

- Age - Vulnerable to separation ages 6 months to 4 years
- Temperament - Easy-going are more resilient
- IQ - Greater skill, greater sensitivity
- Internal locus of control
- Positive sense of the future
- Humor

**FAMILY AND COMMUNITY CORRELATES OF RESILIENCE**

- One good parent
- Positive adult identification figure
- Stable family
- Positive relationship with caretakers
- External support

**MEDIATING MECHANISMS**

- Risk reduction
- Negative chain-reactions
- Self-esteem
- Opportunities
FIVE CHARACTERISTICS OF RESILIENCE

POSITIVE
Display a sense of security and self-assurance that is based on their view of life as complex but filled with opportunity

FOCUSED
Have a clear vision of what they want to achieve

FLEXIBLE
Demonstrate a special pliability when responding to uncertainty

ORGANIZED
Develop structured approaches to managing ambiguity

PROACTIVE
Engage change rather than defend against

From Connor, Managing at the Speed of Change
